

STERN SOAP & WATER REMOTE CONTROL

07 FEBRUARY 2018: This has certainly been a great start to what looks to be another successful year of innovation at Stern. We are proud to uncover our new concealed sensor range of touch free, wall mounted, dual power, electronic faucets and automatic soap dispensers.

In addition, our SWAR complete sanitary cabinet has already been installed for use in various applications worldwide. This is just the beginning and with so many new projects in the pipeline we promise to keep you updated on developments as and when they happen.

CONCEALED SENSOR RANGE

This new range of concealed sensor faucets and soap dispensers has been designed for faster response time and vandalism prevention, by integration of the sensor in the spout. Models are available in both chrome finish on solid brass or Stainless Steel AISI 316.

The concealed sensor range can be installed in concrete or brick walls, whether back access is available or not, depending on the model. In addition, certain models feature an integrated back up system for continued use in case of power failure.

This complete sanitary cabinet with lockable mirror includes a touch free faucet operated by IR sensor, an electronic touch free soap dispenser, a state of the art high speed hand dryer as well as LED pictograms for intuitive user guidance and design.

This touch-free soap-water-air cycle product, holds everything in one place, above the sink preventing dripping across washroom floors and the inevitable queues for the hand dryer in high traffic environments. It is delivered as one piece for easy installation.

At Stern, we continue to research the latest technological advancements in order to create innovative and environmentally responsible products for our customers around the world. We strive to design better solutions that meet new and changing requirements while insisting on Stern quality and modern style and design.

For details on these or any other Stern products please do not hesitate to contact us.
